

Changelog

All notable changes to Piper are documented here. The format follows [Keep a Changelog](#), and Piper uses [Semantic Versioning](#). While the major version is `0`, any release may contain breaking changes (settings, file formats, plugin API).

Unreleased

0.0.1 — 2026-09-29

First test build — an early preview for trying Piper on macOS and Windows. Installers are **not code-signed** yet.

Added

- HTTP(S) debugging proxy on port 8866: HTTP/1.1, HTTP/2, HTTPS interception with a locally generated root certificate, CONNECT tunnels, WebSocket and Server-Sent Events.
- Fiddler-style session list for hundreds of thousands of sessions, request/response inspectors (Headers, TextView, SyntaxView, WebForms, HexView, Auth, Cookies, Raw, JSON, XML, Caching, ImageView, WebView, Transformer) and auto-detected WebSocket, SSE, gRPC/Protobuf, Multipart/MTOM, SOAP and Atom/OData inspectors; streaming viewer for multi-GB bodies.
- QuickExec, filters, find, statistics, timeline, compare, TextWizard, comments and marks.
- AutoResponder (with `.farx` import/export), breakpoints and

tampering, Composer with cURL import, replay variants.

- JavaScript rules (FiddlerScript replacement) with `registerMenu`, `registerColumn` and a rules editor with hot reload.
- WebAssembly plugin host (sandboxed) with the bundled Fast Infoset decoder.
- System proxy integration on macOS and Windows with crash recovery; upstream proxy, PAC, bypass list; remote devices with QR-code assistant and `http://piper.cert` landing page.
- Automatic authentication (NTLM, Negotiate/Kerberos, Basic) with SSO on Windows (SSPI) and macOS (Kerberos); credentials in the OS secure store.
- Client certificates (mTLS) per host; bandwidth and latency simulation.
- SAZ (Fiddler-compatible) and HAR 1.2 import/export; copy as cURL.
